

docker-compose Install

Docker Compose is a tool used to define and run multi-container Docker applications. The application services are configured using a Compose file. Unlike running docker commands, a single command is all that's required to create and start all the services from your configuration.

Dependencies

```
sudo dnf -y install wget
```

Download latest compose

```
curl -s https://api.github.com/repos/docker/compose/releases/latest \  
| grep browser_download_url \  
| grep docker-compose-linux-x86_64 \  
| cut -d '"' -f 4 \  
| wget -qi -
```

Make the binary file executable

```
chmod +x docker-compose-linux-x86_64
```

Move the file to your PATH

```
sudo mv docker-compose-linux-x86_64 /usr/local/bin/docker-compose
```
